

Registered .AI domains (total)

43% of .AI domains are registered to unrelated third parties while 49% still have matching .AI domains available.

Research is indicating a 350% rise in domain disputes over .AI extensions.

About 42 countries, including Anguilla, have adopted the UDRP.

it's not necessary for the trademark owner to have a trademark registration in Anguilla. If the complainant has trademark rights in the U.S. or any other market, that would be sufficient to bring the dispute.

Brand monitoring of additional top level domains. Recently Extended to .AI for a much larger coverage.

“As of early June, 2023, we treat .ai as a gTLD in Google Search, so yeah, you can use it for your global presence!”

Gary Illyes (Google)

Generic Country Code Top Level Domains (ccTLDs): Google treats some ccTLDs (such as .tv and .me) as gTLDs, as we've found that users and website owners frequently see these more generic than country-targeted.

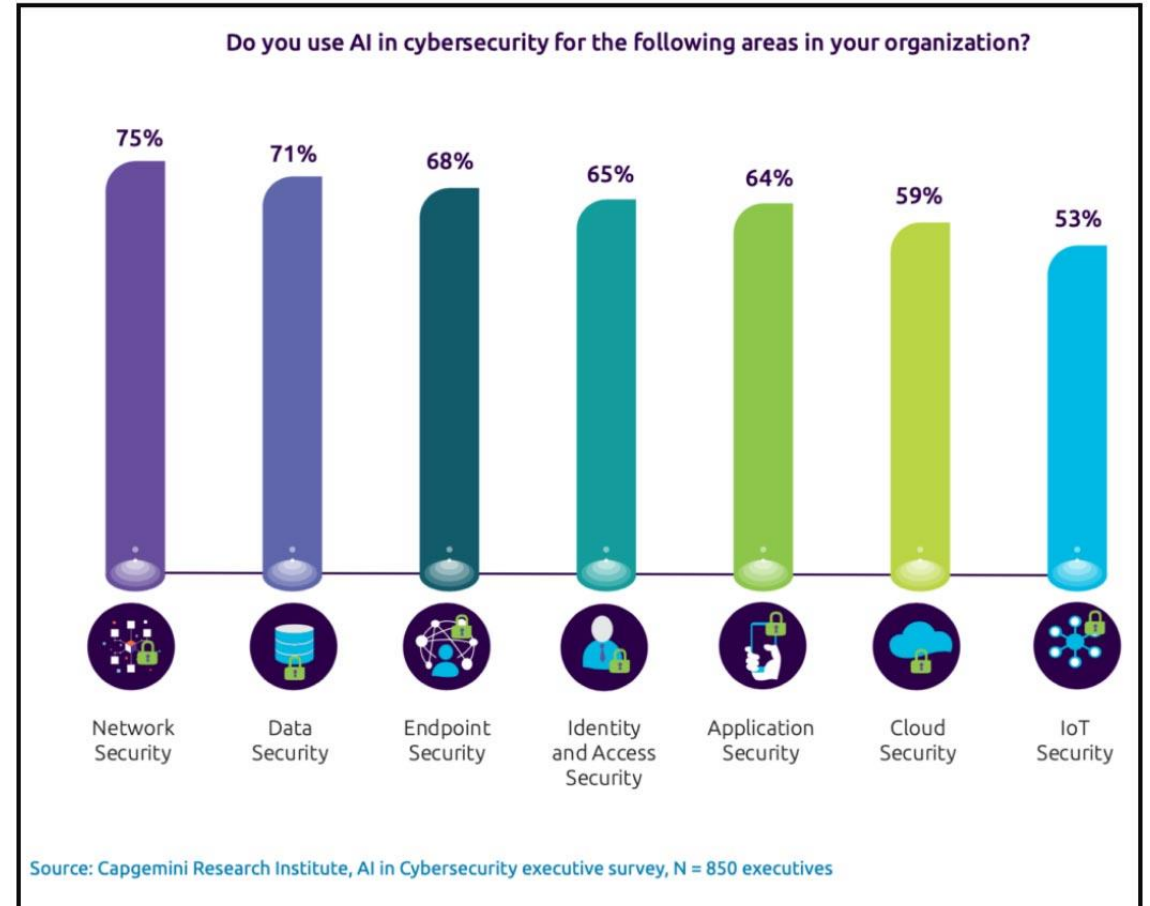

Here is a list of those ccTLDs (this list may change).

.ad	.ai	.as	.bz	.cc
.cd	.co	.dj	.fm	.io
.la	.me	.ms	.nu	.sc
.sr	.su	.tv	.tk	.ws

In February, Microsoft and OpenAI said they found and shut down OpenAI accounts belonging to “five state-affiliated malicious actors” using AI tools, including ChatGPT, to carry out cyberattacks. The accounts were associated with Chinese-affiliated Charcoal Typhoon (CHROMIUM) and Salmon Typhoon (SODIUM), Iran-affiliated Crimson Sandstorm (CURIUM), North Korea-affiliated Emerald Sleet (THALLIUM), and Russia-affiliated Forest Blizzard (STRONTIUM) according to OpenAI and Microsoft Threat Intelligence.

Not only has AI become a powerful defense mechanism, but it has also given rise to a new generation of cyber threats. Attackers can now exploit AI’s capabilities to wreak havoc. Machine learning algorithms can be trained to find and exploit software vulnerabilities, enabling more precise and efficient attacks. Intrusion detection evasion, once the domain of skilled hackers, is now augmented by AI. Attackers can use AI algorithms to identify patterns in security systems and devise strategies to bypass them. Even AI-powered phishing attacks, capable of crafting convincing messages by analyzing communication patterns, pose significant challenges.

AI-Driven Domain Name Generation
Automated Domain Appraisal and Pricing
Automated Domain Name Management
Enhanced Security and Threat Detection

The screenshot shows the .inc Domain Name Generator interface. At the top left is the .inc logo with the tagline "MEANS BUSINESS". To the right are navigation links: "Retailers", "Who's buying", "Tools", "FAQ", and "Get In Touch". The main heading is "Domain Name Generator". Below it is a sub-heading: "Domain Name Generator is a free tool, brought to you by .Inc Domains, that allows you to generate domain name ideas instantly." There are four input fields: "Company Name", "Current Domain / URL", "Select industry..." (with a dropdown arrow), and a "Generate Suggestions" button. Below the inputs is a note: "It's free, secure, and powered by machine learning to get you the best results." At the bottom, there are four tabs: "Name Style" (selected), "Randomness", "Brand Info", and a settings gear icon. Under "Name Style", there are eight options, each with a radio button and a "new" tag next to "Auto": "Auto new" (All styles), "Brandable names" (like Google and Rolex), "Evocative" (like RedBull and Forever21), "Short phrase" (like Dollar shave club), "Compound words" (like FedEx and Microsoft), "Alternate spelling" (like Lyft and Fiverr), "Non-English words" (like Toyota and Audi), and "Real words" (like Apple and Amazon).
